

Using oxygen-enrichment cuts down GHG- and other emissions and makes it possible to use alternative fuels.

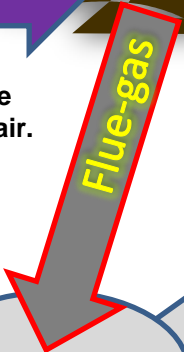

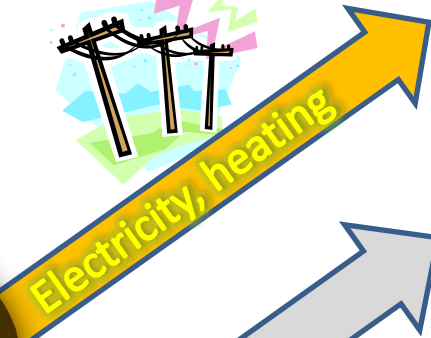

Environmentally sustainable fuels such as wood chips, pellets or even household waste can be used when burned with O₂-enriched air.

Feldspar is a mineral characterized by the presence of aluminum (Al) and silicate (SiO₄). It makes up almost 60% of the earth's crust.

Any reasonably clean water even low- to mid-salty sea-water.

- SiO₂ (for solar-panels)
- Li₂CO₃ (batteries) from spodumene
- Al₂O₃ (aluminum production)
- Rb, Cs, Sc, Ga, Ge, Ta, etc.

Can be used for roads-beds and as construction material.

Harmless to the environment and actually a *necessity* for corals and plankton.
